Subject: H124 - LAN Switch Configuration

The LAN switch should be configured to implement the following features:

1.) Non-trunk interfaces should be set to access mode and left the default of dynamic.
2.) Evaluate the MAC-address table and ports that only connect to one device, should have port security set to allow only 1 device.
3.) Unused interfaces should be shutdown.
4.) Administration of the device should be limited to your internal LAN segments.
5.) VTY lines should be password protected.

Reply with a business memo and screen shots documenting these configuration elements.

Thank you.

IT Director
