Subject: H105 - Screening FW Architecture

Using the 2811 router, develop a screening FW architecture by placing access lists to control both inbound and outbound packets to only that that are expected by the services that you are offering to the external network (Internet). Use an explicit deny in these lists that log failed packets to the centralized syslog server.

Reply with a memo that shows the access lists and the interface configuration that applies them. Supply a screen show from the syslog server that validates that records are being recorded there from the router.

Thank you.

IT Director
